                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated protein complex comprising 2 proteins. The protein complex comprises: (a) a first protein (P1) and a second protein (P2); (b) a fragment P1 and P2; (c) P1 and a fragment P2; and (d) a fragment of P1 and a fragment P2. The first and a fragment P2 is of the complex are selected from: (i) P1 is SET, and P2 is PN12218; (ii) P1 is TTP and P2 is CN85 or PN13734; or (iii) P1 is TAR and P2 is FN12218; (ii) P1 is TTP and P2 is CN85 or PN13734; or (iii) P1 is TAR and P2 is FUBP1. The methods and compositions of the present invention are useful for the diagnosis and/or treatment of physiological disorders involved in the protein-protein interaction, such as inflammatory disease, modulators, inhibitor or compounds are useful for treating the diseases described above. The present sequence represents the nucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Neuroprotective; cytostatic; dermatological; immunosuppressive; tumour; antiinflammatory; anti-HIV; antibacterial; antiinflammatory; cancer; immune system disorder; rheumatoid archritis; inflammatory condition; organ transplant rejection; infection; hepatitis C; blood disorder; sickle cell anaemia; hyperproliferative disorder; Gaucher's disease; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease; chromosomal abnormality; Down syndrome; ischaemia; renal disorder; cardiovascular; respiratory; wound healing; endocrine; Addison's disease; reproductive system; gastrointestinal; liver disorder; AlDS; ds; acquired immune deficiency syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNA encoding novel signal transduction pathway protein, Seq ID 1313.
                                                                                                                                                                                                                                                                                                      New isolated protein complex comprising a first and second protein, useful for the diagnosis and treatment of disorders involved in the protein-protein interaction, such as inflammatory disease, atherosclerosis or hypoxic brain injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 8490 BP; 2392 A; 1901 C; 1823 G; 2374 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  08-DEC-2000
                                                                                                                                                                                                                                                                                                                                                                          17-NOV-200
                                                                                                                                                                                                                                                08-NOV-2
                                                                                                                                                                                                                                                                       08-NOV-2
```

```
The invention relates to novel isolated polypeptides (I), and display to (I). (II) and the antibody to (I) are useful for diagnosing, preventing and treating diseases including immune system disorders (e.g. congenital and acquired immunodeficiencies, autoimmune disorders (e.g. congenital and acquired immunodeficiencies, autoimmune creations and graft versus host disease, infectious diseases (reg. pepatitis C), bleeding disorders, haemoglobin abnormalities and cher blood-related disorders (sickle cell anaemia), myeloproliferative disorders, primary haematopoietic disorders, hyperproliferative disorders (e.g. disease, adisease), chromosomal abnormalities and disorders, primary haematopoietic disorders, hyperproliferative disorders (e.g. Gaucher disease, Parkinson's disease), chromosomal abnormalities (c.g. Lown syndrome), ischaemic injury (e.g. stroke), renal disorders (e.g. disease), cardiovascular disorders (e.g. arrhythmia), respiratory disorders, dermatological disorders (e.g. Addison's disease), reproductive system disorders, gastroinesstinal disorder (inflammatory disorders), liver disorders (cirrhosis), as stimulators of B-cell responsiveness to pathogens, activators of T-cells, to induce (inflammatory disorders) index ameans to induce tumour proliferation in pathologies e.g. acquired immune deficiency syndrome (AIDS). AAS26976-AAS27880 represent novel signal transduction pathway protein coding sequences and PCR primers of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Neuroprotective; cytostatic; dermatological; immunosuppressive; tumour; antinflammatory; anti-HIV; antibacterial; antinflammatory; cancer; immune system disorder; rheumatoid arthritis; inflammatory condition; organ transplant rejection; infection; hepatitis C; blood disorder; sickle cell anaemia; hyperproliferative disorder; Gaucher's disease; neurodegenerative disorder; Alzheimer's disease; parkinson's disease; chromosomal abnormality; Down syndrome; ischaemia; renal disorder; cardiovascular; respiratory; wound healing; endocrine; Addison's disease; reproductive system; gastrointestinal; liver disorder; AlDS; ds; acquired immune deficiency syndrome.
                                                                  Novel polypeptides useful for diagnosing, treating, preventing and/or prognosing disorders related to the proteins, including cancers, immune disorders and neuronal disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             25-SEP-20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        disease
The invention relates to novel isolated polypeptides (I), and the invention relates to novel isolated polypeptides (I), and the antibody to (I) are useful for diagnosing, preventing and treating diseases including immune system disorders (e.g. congenital and acquired immunodeficiencies, autoimmune traplations and graft versus host disease, infectious diseases (ransplant relections and graft versus host disease, infectious diseases (e.g. traplations and graft versus host disease, infectious diseases (e.g. traplations and graft versus host disease, infectious diseases (e.g. disorders, primary haematopoietic disorders, hyperproliferative disorders (e.g. Gaucher's disease, Parkinson's disease), reproductive disorders (e.g. Alzheimer's disease, Parkinson's disease), chromosomal abnormalities (C.g. Jomerulonephritis), cardiovascular disorders (e.g. arrhythmia), respiratory disorders, dermatological disorders (in wound healing, epithelial cell proliferation, endocrine disorders (e.g. Addison's disease), reproductive system disorders, garrhythmia, epithelial cell proliferation, endocrine disorders (e.g. Addison's disease), reproductive system disorders (cirrhosis), as stimulators of B-cell responsiveness to pathogens, activators of T-cells, to induce (inflammatory disorders), liver disorders (cirrhosis), as stimulators of higher affinity antibodies, and as a means to oi induce tumour proliferation in pathologies e.g. acquired immune deficiency syndrome (AIDS). AAS26976-AAS27850 represent novel signal transduction pathway protein coding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .

```
The invention relates to an isolated polypeptide. The polypeptide is useful for diagnosing a pathological condition or a susceptibility to a pathological condition in a subject, by determining the presence or amount of expression of the polypeptide in a biological sample and diagnosing a pathological condition or a susceptibility to a pathological condition based on the presence or amount of expression of the polypeptide is also useful for identifying a binding partner and determining whether the binding partner or othe polypeptide is also useful for identifying a binding partner and determining whether the binding partner or acid enceding the polypeptide is useful for preventing, treating, or acid enceding the polypeptide is useful for preventing, treating or ameliorating a medical condition, which involves administering the polypeptide or the nucleic acid to a mammalian subject. The nucleic acid can use useful for diagnosing a pathological condition or a susceptibility to a pathological condition in a subject, which involves determining the presence or absence of a mutation in The nucleic acid, and diagnosing a pathological condition or susceptibility to a pathological condition or susceptibility 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated polypeptide useful for diagnosing and treating immunosuppressive conditions such as autoimmune disease and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Disclosure; SEQ ID NO 1312; 345pp; English.

```
the nucleic acid and the antibody are useful as immunosuppressive agents, as a adjuvants to enhance elegences, and as agents to induce higher affinity antibodies and increase serum immunoglobulin concentrations. The present sequence represents DNA encoding a novel human protein. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format direct from USPTO at seqdata.uspto.gov/sequence.html?DocID=20020168711.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ds; gene; human; autoimmune disease; Parkinson's disease; silicosis; gastrointestinal disease; atherosclerosis; haemophilia; thrombocytopenia; fimunosuppressive agent; adjuvanti, enhance immune response; higher affinity antibody induction; increased serum immunoglobulin concentration.
                                                                                                                                                                                                                                                                                                                           Gaps

The invention relates to an isolated polypeptide. The polypeptide is useful for diagnosing a pathological condition or a susceptibility to a pathological condition in a subject, by determining the presence or amount of expression of the polypeptide in a biological semple and diagnosing a pathological condition or a susceptibility to a pathological condition based on the presence or amount of expression of the condition based on the presence or amount of expression of the perpetide. The polypeptide is also useful for identifying a binding partner to the polypeptide which involves concacting the polypeptide or the polypeptide is useful for preventing the polypeptide or the nucleic acid encoding the polypeptide; The polypeptide or the nucleic acid encoding the polypeptide is useful for preventing the polypeptide or the nucleic acid encoding a medical condition, which involves administraing the polypeptide or the nucleic acid to a pathological condition or a susceptibility to a pathological condition or a susceptibility to a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition or based on the presence or absence of the mutation. The polypeptide, the nucleic acid and an antibody to the polypeptide are useful for treating disease, atherosclerosis, haemophilia, thrombocytopenia. The polypeptide of the nucleic acid and the antibody are useful as immunosuppressive agents, as adjuvants to enhance immune responses, and as agents to induce higher affinity antibodies and increase serum immunosuppressive acid and the antibody are useful as immunosuppressive account and the antibody are useful as agents to induce higher expressive pathological conditions and increase serum immunosuppressive the processive and as agents to induce the sequence data for this patent did not form part of the prince for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated polypeptide useful for diagnosing and treating immunosuppressive conditions such as autoimmune disease and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 29220 BP; 7863 A; 6353 C; 6337 G; 8667 T; 0 U; 0 Other;

The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sample indicates the cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences and be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated DNA of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.
                                                                                                                                                                                                    soft tissue sarcoma; cytostatic; gene therapy; vaccine; screening; human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Barly detection of soft tissue sarcoma comprises determining expression of a gene in a first soft tissue sample and a normal soft tissue sample and comparing the gene expression, also useful in treating soft tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 158811 BP; 50626 A; 28156 C; 29409 G; 50620 T; 0 U; 0 Other;

```
The present invention describes a method for separating multipotential neural progenitor cells from a mixed population of cell types in which a promoter functioning selectively in the neural progenitor cells is selected. A nucleic acid molecule encoding a fluorescent protein is introduced to all cell types of the mixed population of cell types under control of the promoter. Only the neural progenitor cells (not the other mixed population of cell types that are fluorescent protein, cells of the mixed population of cell types that are fluorescent, which are restricted to the neural progenitor cells, are identified. The fluorescent cells are separated from the mixed population of cell types, the separated cells are are restricted to the neural progenitor cells. The present invention also describes: (1) an isolated human masship promoter, and (2) an enriched or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             purified preparation of isolated multipotential neural progenitor cells. The method is used for separating multipotential neural progenitor cells from a mixed population of cell types. The present sequence represents the human musashi promoter DNA sequence which can be used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                 Isolation and purification of multipotential neural progenitor cells and multipotential neural progenitor cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 52216 BP; 13494 A; 12460 C; 12362 G; 13900 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents the human musashi promoter, which is used in the method of the invention. The specification describes a method for separating multipotential neural progenitor cells from a mixed population of cell types. The method comprises introducing a nucleic acid encoding a fluorescent protein under control of a promoter which selectively functions in the progenitor cells, into all cell types of the mixed population, allowing only the progenitor cells to express the fluorescent protein, and identifying and separating cells that are fluorescent where the separated cells are progenitor cells. The method is useful for isolation and purification of multipotential neural progenitor cells, especially neural stem cells from adult brain. The isolated cells are used in both basic analyses of precursor and stem cell growth control, as well as in more applied studies of their transplantability and control, as well as in more applied studies of their transplantability and control.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Separating multipotential neural progenitor cells from a mixed population of cells, involves introducing nucleic acid molecule encoding fluorescent protein under promoter control, and separating fluorescent cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

```
The present sequence represents a fragment of a mammalian serine racemase gene. The racemase polypeptide has a specific activity of at least 0.003 micromole L-serine/mg/hour. The enzyme catalyses the direct racemisation of L-serine to D-serine. D-serine appears to be an endogenous ligand of N-methyl-D-aspareate (NMDA) receptors. The mammalian serine racemases can be used to identify modulators, which can be used in the treatment of acute or chronic neural death or dysfunction mediated by overactivation of N-methyl-D-aspareate (NMDA) receptors. Overactivation of the receptors is associated with Parkinson's disease, Huntington's disease, motor neurone disease and Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Polynucleotide encoding serine racemase enzyme and the enzyme useful for screening reagents regulating the activity of the enzyme in a neuron disease caused by over- or under-activation of glutamate N-methyl-D-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is that of cDNA encoding human serine racemase (see AAM50262). The polynucleotide can be used in the production of recombinant serine racemase enzyme, or for the detection of serine
                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mammalian serine racemase preparations, used to identify modulators which can be used to treat diseases associated with N-methyl-D-aspartate receptor overactivation, e.g. Alzheimer's disease.
                                                                                                                                                                                                                                                                The present sequence is that of primer B, designed for use with primer A (see AAI70576) in the PCR amplification of human serine racemase CDNA (see AAI70575). The expected size of the specific PCR product is 536 bp. Human cDNA phage libraries were used as templates in PCR analysis in order to determine the expression pattern of serine racemase mRNA in human tissue. The invention provides methods of regulating serine racemase activity in order to increase or decrease Duranting serine formation, and thereby increase or decrease glutamate N-methyl-D-aspartate (NMDA) receptor activation. A decrease glutamate N-methyl-D-aspartate (NMDA) receptor activation. A decrease in D-serine formation may aid in the Regulation of neuron damage following an ischaemic event, such as stroke. Regulation of D-serine formation may also aid in the treatment of other neurodegenerative conditions caused by the over- or under-activation of

damage following various nervous system diseases is often caused by activation of glutamate N-methyl-D-asparate (NMDA) receptors in the brain. This receptor is activated by the binding of D-serine. Requlation of D-serine levels through regulation of serine racemase may therefore prevent or minimise neuron of serine racemase may therefore neurodegenerative disorders such as Alzheimer's disease and parkinson's disease, and disorders such as Alzheimer's disease and Parkinson's cacemase polypeptides and polymolectides are used in claimed methods of screening for agents that modulate or decrease the activity of serine racemase. Also claimed is a pharmaceutical composition comprising either an expression vector that contains a serine racemase polymuclectide, or a cagent that modulates serine racemase polymuclectide, or a modulate serine racemase enzyme activity. This is used to modulate serine racemase enzyme activity. This is used to damage or a neurodegenerative disease caused by the over- or under-

The present sequence is a cDNA encoding human pyridoxal phosphate dependent enzyme 22406 which is a serine racemase. Human 22406 gene is located on chromosome 17 between D17849 and D178796. The protein 22406 is a modulator of D-serine. D serine has been shown to modify behavioural changes associated with learning, memory and convolsions. Human 22046 and diagnose neurodegenerative discorders including Alzheimer's disease, schizophrenia as well as quell anxiety and epilepsy and prevent damage from stroke as well as quell anxiety and epilepsy and prevent damage from stroke as well as cardiac (heart failure, rheumatic heart failure) and circulatory disorders, liver disorders (heaptic injury, jaundice), hung disorders, prostrate disorders (benign enlargement, nodular hyperplasia), colon disorders (action and dermal fibroblast disorders. Human 22406 cDNA is also useful in gene therapy ö Human; pyridoxal-phosphate dependent enzyme; 22406; acyltransferase; 32447; AfPase; 7716; aminotransferase; 25233; ring finger protein; 8035; 84242; aminopeptidase; 55304; metallopeptidase; 5299; anthopeptidase; 51999; metallopeptidase; 5299; ADP-ribosyltransferase; 21999; metallopeptidase; 52020; ADP-ribosyltransferase; 21999; metalloma associated antigen; 52020; heart failure; ischaemic heart disease; mycorafial inferction; viral hepatitis; cancer; intracerebral haemorrhage; brain abscess; viral hepatitis; cancer; intracerebral haemorrhage; brain abscess; viral hepaticus's disease; amyotrophic lateral sclerosis; inflammatory bowel disease; Crohn's disease; inflammatory bowel disease; Crohn's disease; Gaps cDNA encoding human pyridoxal-phosphate dependent enzyme, 22406. ö Sequence 1770 BP; 499 A; 379 C; 410 G; 482 T; 0 U; 0 Other; 80.0%; Score 16; DB 5; Length 1770; 100.0%; Pred. ```
The present invention relates to the isolation of a novel human pyridoxal phosphate dependent enzyme family member (22406), a human argued enzyme family member (22406), a human aminotransferase (25233), human ring finger proteins (8035 and 84243), a human minotransferase (25233), human ring finger proteins (8035 and 84243), a human ADP-cribosyltransferase (21999), and a human melanoma associated antigen (52030). Also disclosed are the polynucleotide sequences encoding these novel human proteins. The polynucleotides and polypeptides of the present invention are useful for diagnosing and treating discrers, such as heart canner, and the standard discase, such as heart intracerebral haemorrhage, brain abscess, Alzheimer's disease, Pick disease, Pick disease, amyotrophic lateral seclerosis, inflammatory bowel disease, Crohn's disease, benign prostatic hypertrophy and systemic lupus erythematosus. The present sequence encodes a human protein of the invention.
                                                                                                                                                                                                                                                                                                              New isolated 22406 nucleic acids and polypeptides, useful for diagnosing and treating 22406-mediated disorders, such as myocardial infarction, hypertension, atherosclerosis, viral hepatitis, cancer and/or Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 1770 BP; 499 A; 379 C; 410 G; 482 T; 0 U; 0 Other;

Identifying a candidate p21 pathway modulating agent, useful for treating a disease such as cancer, comprises contacting an assay system comprising a MP21 polypeptide or nucleic acid with a test agent.

Example 2; SEQ ID NO 48; 392pp; English.

This invention relates to a novel candidate p21 pathway modulating agent by contacting an assay system comprising an MP21 (modifier of p21) to polypeptide or nucleic acid with a test agent, where in the absence of the test agent the system provides a reference activity and detecting a test agent-biased activity of the assay system. The invention may be useful for the production of compounds with a cytostatic activity through modulation of MP21 protein activity. The MP21 polypeptide or nucleic acid can be used for identifying MP21 modulating agents useful as therapeutic targets for diagnosing cancer or treating disorders associated with a respective or impaired p21 and/or MP21 function. MP21 modulating agents are useful in diagnosis, therapy, for example treating cancer, and pharmaceutical development. The genetically modified animals may be used for in vivo assays to test for activity of a candidate p21 modulating agent, or to further assess the role of MP21 in a p21 pathway process. The present sequence is that of a human M21 gene which is an orthologue of a prosophila p21 modifier and which was used in the exemplification of the invention.

Sycamors in Direct Submission

Submitted (18-JUL-2001) Sanger Centre, Hinxton, Cambridgeshire, CENO 18A, UK. E-mail enquirties: humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk

On Jul 19, 2001 this sequence version replaced gi:14715342.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences unit only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: EMB, Sw., SWISSPROT; Tr., TREMBL; Wp., WORWPEP; Information on the WORMPEP database can be found a tt., Armington whis seminered
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 9, constructed by the Sanger Centre Chromosome 9 Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/Chr9 RPII-3011 is from the library RPCI-11.1 constructed by the group of bieter de Jong. For further details see http://www.chori.org/bacpac/home.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ALISS692 78376 bp DNA linear PRI 18-JUL-2001
Human DNA sequence from clone RPI1-3411 on chromosome 9, complete
sequence.
                                                                                                                  Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,

NOTE: This is a 'working draft' sequence. It currently consists of 50 contigs. The true order of the places is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Workley, n.v.

                                                                                                                                                                                                                                                                                                                                                                                   Submitted (13-MAY-2003) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA.

On May 13, 2003 this sequence version replaced gi:23110872.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bom.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a "working draft' sequence. It currently consists of 1 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor. This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

1 217073: contig of 217073 bp in length.

* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such one plasmid subclone or more than one Mil subclone, and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em.; EMBL; Sw.; SMISSPROT; Tr.; TREMBL; Wp.; WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/FGP/Chr!

RP4-796FB is from the library RPCI-4 constructed by the group of Pieter de Jong. For further details see http://www.chori.org/bacpac/home.htm

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       * NOTE: This is a 'working draft' sequence. It currently consists of 21 conties. The true order of the pleces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as * runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1: contig of 3615 bp in length

                                                                                                           Direct Summission

Submitted (19-NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On Nov 19, 2002 this sequence version replaced gi:23194726.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas and whole genome shotgun sequencing reads assembled using Atlas in the feature table below represents a caffold in the Atlas assembly (a 'contig-scaffold'). Within each contig scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               * NOTE: Estimated insert size may differ from sequence length

* (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

* vOTE: This is a 'working draft' sequence. It currently

* consists of 3 contigs. The true order of the pieces

* is not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* runs of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be preserved.

NOTE: This is a 'working draft' sequence. It currently consists of 76 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                     Unpublished to 172869)

Rat Genome Sequencing Consortium.

Submitted (10-MAY-2003) Human Gencence Sequencing Center, Department of Moderular and Human Genceics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA.

On May 10, 2003 this sequence version replaced gi:25012181.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold in the Atlas by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the entime to reduce and criented, and separated by sized gaps filled with Ns to the estimated size. The sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html). NOTE: This is a "working draft' sequence. It currently consists of 1 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.

This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                    Submitted (21-OCT-2002) Human Genome Sequencing Center, Departmen of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA 3 (bases 1 to 217844) Rat Genome Sequencing Consortium.

It currently consists of 6 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Center: Washington University Genome Sequencing Center

Direct Submission

Submitted (20-NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On Nov 20, 2002 this sequence version replaced gi:23321944.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.ucid/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence conly contigs will be indicated in the feature table.

NOTE: This is a "working draft' sequence. It currently consists of 10 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N. but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Direct Submission

* consists of 3 contigs. The true order of the pieces
* tis not known and their order in this sequence record is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ô
                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                        arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     87.0%; Score 17.4; DB 2; Length 252630; 94.7%; Pred. The sequence in this sesembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.bgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Worley, K.C.

COMMENT

```
by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html)
NOTE: This sequence may represent more than one clone.
NOTE: This is a 'working draft' sequence. It currently consists of 8 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

The WGS reads were placed uniquely on the MGSC3 C57BL/6J assembly and SNP detection was carried out by SSAHA-SNP. 225,000 reads were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        as STSs and 81,000 SNPs were annotated with alleles from C57BL/6J and the strain from which the particular read came. The validation rate for these SNPs was estimated at approximately 98%.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,

FEATURES

```
During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone amen. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em:, SMISSROT; Tr:, TREMBL; Wp:, WORNPEP; Information on the WORMPEP database can be found at the their source databases:

Em:, EMBL; Sw:, SWISSROT; Tr:, TREMBL; Mp:, WORNPEP; Information on the WORMPEP database can be found at his plane, inconsistency over the length of monouncleotide A/T runs and conserved TA repeats. Where the which it is found the longest good quality representation will be

                                                                                                                                                                                                                                                                                                  NOTE: This is a 'working draft' sequence. It currently consists of 9 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            184975 bp DNA linear PRI 07-
Human DNA sequence from clone RP3-435D1 on chromosome Xq25,
complete sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

Quality cov.
* Working draft' sequence. It currently
* consists of 23 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* truis of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                         During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone mame. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a MAC.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em:, EMBL; Sw:, SW:SSROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/FOPjects/C elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromaper. Further information can be found at http://www.sanger.ac.uk/GOP/ChrX

RPS-435D1 is from the library RPCI.3 constructed by the group of Pieter de Jong, For further details see http://www.chori.org/bacpac/home.htm

AL Submitted (08-007-2002) Human Genome Sequencing Center, Department of Modecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA on Seq 14, 2002 this sequence version replaced gi:21908462. On Sep 14, 2002 this sequence version replaced gi:21908462. The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projecs/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome table.

NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank draft data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 3 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    nclusz84 247342 bp DNA linear HTG 13-MAY-2003

Direct Submitted (15-NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

ON Nov 15, 2002 this sequence version replaced gi:23603922.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas and whole genome shotgun sequencing reads assembled using Atlas in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig described in the feature table below represents a scaffold, and separated by sized gaps filled with Ns to the estimated size. The sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads.

My Direct Submission

AL Submitted (09-MAY-2003) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On May 9, 2003 This sequence version replaced gi:24818314.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a caffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome table.

NOTE: This sequence may represent more than one clone.
NOTE: This is a 'working draft' sequence. It currently consists of 3 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Assembly program: Alias;
